A: Since any physical (digital) storage is irreversible, in the real sense, if it's a reversible encryption scheme, it's a zero effort cheat. It does not matter how complicated (physically) the encryption/decryption is, it's basically a one click, zero effort way to steal your documents, by taking advantage of the fact that any untrustworthy computer could as well access the contents of your device. A PDF is simply a zip with some header and one or more files in it. When you open the file with an application like Winzip or 7-zip, it will automatically unzip the ZIP file with the header and separate the various PDF files with their respective filenames. Which one the application will open depends on how you call it. The application might or might not save all the files in the right place. It's up to the application and the user (the same applies to a ZIP file, even more so since you wouldn't always get the filename for the content of a ZIP file, since this is likely to change if you rename it). Your documents might be encrypted in your PDF reader, or they might not be. A USB-stick would work too since the files are transferred as if they were regular files. There are probably other ways too. It doesn't really matter if it's encrypted or not, since your documents are likely to be recoverable if the malware has access to your machine (the files are loaded by the malware so they would have to be somewhere), as long as the malware has access to the key, which is sent as part of the encryption. There is no issue with it being a reversible encryption. It's a zero effort cheat, and by "cheat" I
