Description: Ezdit has been designed to provide a simple way of organizing your data. This straightforward structure is based on a tree, a hierarchical structure where each node has its own parent or child node and its own properties. It is almost impossible for people who have never used it to break free of its limits. Ezdit allows you to create and manage as many tree structures as you like. The very nature of a tree also allows you to make all kinds of queries. You can go up a hierarchy and see what's there. You can get back to the root from a node. You can go down a hierarchy and see what's below that node. You can even go down and up and make the hierarchy triangular. It doesn't matter whether you are a programmer or a journalist, a lawyer or a housewife, you will find Ezdit useful for your daily work. One of the best features of Ezdit is the possibility of opening existing files in other formats. This can be done with all the files produced by Microsoft Word or LibreOffice. A tree with multiple nodes can be used to store the data of a newspaper, a family tree or a personal database. Ezdit has all the tools you need. The tree and the editor are not two separate entities. Both are built on the same infrastructure and so they work harmoniously. Each of them has its own independent features. For example, in the tree pane of Ezdit you can access files, folders and sub-folders. You can navigate through the contents of a file or a folder. You can enter a file into the editor and save it under another file or another folder. The editor has its own editor window in which you can see your content, select the text, change the text, format the text, and do all the things that you would need to do with the text.
